Updates for Administrators

Bomgar Privileged Access 18.2 contains the following updates for Bomgar administration.

Feature
Idle Timeout Warning for /login Improved idle timeout warnings in the /login interface will prevent administrators from getting logged out before changes are complete. A new idle timeout dialog gives users 90 seconds to acknowledge that you are still working.
SCIM Utilize SCIM 2.0 REST Endpoints to provision users and groups to the available security providers.

Idle Timeout Warning for /login

Improved idle timeout warnings in the /login interface will prevent administrators from getting logged out before changes are complete. A new idle timeout dialog gives users 90 seconds to acknowledge that you are still working.

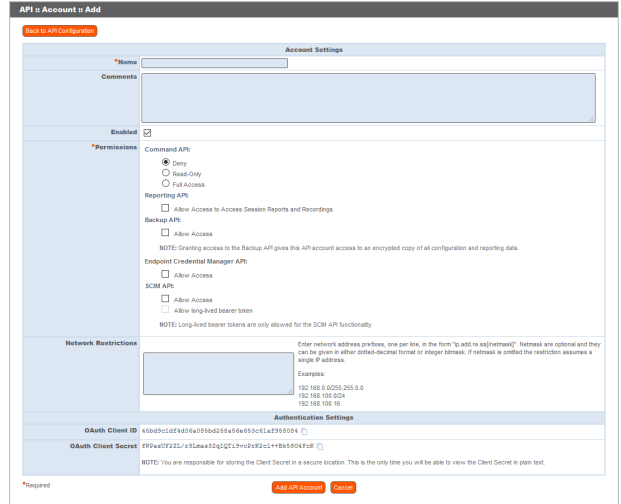

SCIM

Utilize SCIM 2.0 REST Endpoints to provision users and groups to the available security providers.

Updates for Users

Bomgar Privileged Access 18.2 contains the following updates for Bomgar users.

Feature
Direct Advanced Web Access Login Access the Web Console directly from a new /console URL. By providing a simplified URL to access to the Web Access Console, users can start using Bomgar more quickly, and administrators can now apply Network Restrictions more granularly to the Web Access Console users.
Faster Jump Client Reconnect When active Jump Clients lose their connection, their built-in logic ensures a staged reconnect back to the appliance. Improvements to the Jump Client reconnect logic have significantly reduced the amount of time needed for large-scale deployments to reconnect to the appliance.
SecureApp SecureApp has been extended to accommodate starting more applications. With the use of the new Bomgar RDP agent, applications can be started without the need to configure them as a RemoteApp. Also, credentials can be used to start any application, extending the use of your managed privileged identities.

Direct Advanced Web Access Login

Access the Web Console directly from a new /console URL. By providing a simplified URL to access to the Web Access Console, users can start using Bomgar more quickly, and administrators can now apply Network Restrictions more granularly to the Web Access Console users.

Faster Jump Client Reconnect

When active Jump Clients lose their connection, their built-in logic ensures a staged reconnect back to the appliance. Improvements to the Jump Client reconnect logic have significantly reduced the amount of time needed for large-scale deployments to reconnect to the appliance.

Global connection rate for Jump Clients

NOTE: When a Jump Client goes offline, it knows that it needs to reconnect as soon as possible, but a single Jump Client doesn't know if it's the only one offline or if all Jump Clients are offline. The global connection rate setting is used by disconnected Jump Clients as a clue to know how aggressively to try to reconnect.

SecureApp

SecureApp has been extended to accommodate starting more applications. With the use of the new Bomgar RDP agent, applications can be started without the need to configure them as a RemoteApp. Also, credentials can be used to start any application, extending the use of your managed privileged identities.
